How to Install and Configure Cobbler on CentOS 7.x

Upstream hasn't updated the distro_signatures.json file yet to support Redhat Enterprise Linux 8. In order to get support for RHEL8 in cobbler following the next few steps. Download the RHEL8 iso. (rhel-8.0-x86_64-dvd.iso) Edit distro_signatures.json and add the following node in the redhat object, under rhel7 is probably preferred.

RHEL 8 in cobbler - Daniel T Prince

cobbler is a provisioning (installation) and update server. It supports deployments via PXE (network booting), virtualization (Xen, QEMU/KVM, or VMware), and re-installs of existing Linux systems. The latter two features are enabled by usage of 'koan' on the remote system. Update server features include yum mirroring and integration

Cobbler Documentation - Read the Docs

Repository mirroring allows cobbler to mirror not only install trees ("cobbler import" does this for you) but also optional packages, 3rd party content, and even updates. Mirroring all of this content locally on your network will result in faster, more up-to-date installations and faster updates.

3. Cobbler CLI — Cobbler 3.0.1 documentation

5.1.25. enable_menu¶. Controls whether cobbler will add each new profile entry to the default PXE boot menu. This can be over-ridden on a per-profile basis when adding/editing profiles with --enable-menu=0/1. Users should ordinarily leave this setting enabled unless they are concerned with accidental reinstalls from users who select an entry at the PXE boot menu.

5. Cobbler Configuration — Cobbler 3.0.1 documentation

The network installation of Ubuntu (server and altrernate) with-no-questions asked was successful. We got the tool! Install and setup Cobbler. To install cobbler and the later needed dhcp3-server run: sudo software-properties-gtk -e universe. sudo apt-get update.
