Impact of comorbidities on physical activity in COPD

Introduction Chronic obstructive pulmonary disease (COPD) is a major cause of morbidity and mortality. Patients with COPD are characterised by a reduced health status, which can be easily assessed by the COPD Assessment Test (CAT). Previous studies show that health status can be worsened by the presence of comorbidities. However, the impact of cardiovascular comorbidities on health status as ...

quality of life, exacerbation frequency, and survival. There is increasing evidence that certain diseases occur in greater frequency amongst patients with COPD than in the general population, and that these comorbidities significantly impact on patient outcomes.

Epidemiology and clinical impact of major comorbidities in ...

Chronic obstructive pulmonary disease (COPD) is a leading cause of morbidity and mortality worldwide. For many patients, maximal therapy for COPD produces only modest or incomplete relief of disabling symptoms and these symptoms result in a significantly reduced quality of life. Despite the high morbidity and mortality associated with severe COPD, many patients receive inadequate palliative care.
