Seismic Design Factors. The following factors affect and are affected by the design of the building. It is important that the design team understands these factors and deal with them prudently in the design phase. Torsion: Objects and buildings have a center of mass, a point by which the object (building) can be balanced without rotation occurring.

However, when designing critical structures such as dams, high-rise buildings, etc. it is observed that a certain magnitude of peak ground acceleration (PGA) is considered. In this article, we are concentrating on the factors to be considered in seismic design from the preliminary stage to the completion of the design of the structure.

Design of buildings to resist earthquakes involves controlling the damage to acceptable levels at a reasonable cost. Contrary to the common thinking that any crack in the building after an earthquake means the building is unsafe for habitation, engineers designing earthquake-resistant buildings recognize that some damage is unavoidable.
