Seismic design of long-span single pylon cable-stayed bridge at high intensity seismic region has been a difficult issue for designers. There is few references in this aspect at present. Based on the research achievements and the engineering background of a single pylon cable-stayed bridge at high intensity seismic region of East China, a full bridge model is established to analyze dynamic ...

This paper focuses on the performance evaluation of long span cable-stayed bridge. Pushover method has been compared with RHA method to verify its validity. A specific bridge has been calculated by pushover analysis method using several different lateral load patterns. With four typical seismic analysis methods on the structure, the pushover analysis capacity curves have been compared with the ...

was observed in the seismic performance of a 670-m (2200-ft) span cable-stayed bridge model due to large variation in cable sag during seismic excitation. Large seismic energy is also transferred between the bridge deck and towers producing large moments and shear forces at the bases of the bridge towers.

On the Seismic Performance of Superlong Cable-Stayed Bridges

This paper documents the fundamental issues that were considered in the seismic design of recent cable-supported bridges including the seismic performance-based criteria (PBDC). The paper also discusses how the local damage levels are employed through a deformation-based approach to achieve the global performance objectives of the bridge.

Seismic Performance-Based Design of Cable-Supported ...

The seismic performance of a cable-stayed bridge in different fault regions has been evaluated. A larger deformation and strength demand are necessary for the bridges in MR. The deformation demand is essential for the towers in FR, whereas THE strength demand should be a priority for the towers in BR.

Cable supported bridges perform better during earthquakes compared to other types of bridges. There are seismic weak points in cable supported bridges which are likely to become source of damages when the structure experiences an earthquake. It is thought by most bridge engineers that, existing cable supported bridges have not experienced severe ...

Cable Supported Bridges Earthquakes Performance and ...

Review of seismic damage of cable-stayed bridges during past earthquakes The overall seismic performance of cable-stayed bridges was quite satisfactory and no cable-stayed bridges collapsed during past earthquakes. However, several cable-stayed bridges have been reported with earthquake-induced damages as follows. 2.1.

This study quantifies the scour effect on the seismic performance of a single pylon cable-stayed bridge under bidirectional earthquake excitations. Three-dimensional finite-element models, considering the nonlinear soil-structure interaction, the flexure-shear behavior of the bridge pier, and the hydrodynamic force applied to bridge structures, are built on the OpenSees platform.
